

Safety Line Installation Tool

Instructions

Use this handy, lightweight tool to quickly install your safety line from the safety of the landing. The (3) 40" long hollow sections can be assembled into a tool up to 10' long.

Steps:

1. Connect the (3) 40" tubes together ensuring that the male and female ends thread together, and that each connection is completely threaded and tight.
2. Feed the installation cable through the center of the pipes so that the cable eye protrudes from the end you wish to push over the beam.
3. Manipulate the tube assembly so that the installation cable is over the beam, feed the cable through the tube, allowing it to slowly drift down until the loop is within arm's reach, then remove the cable from the tubing and securely hold on to each end of the installation cable.
4. Attach a sling to the eye end of the installation cable with the shackle provided.
5. Feed the free end of the installation cable through the eye of the sling creating a loop.
6. Carefully pull the free end of the cable tightening the loop of the sling against the beam.
7. You now have a sling securely attached to the overhead beam.
