

JACK STANDS

Part No. 11-535
Jack Stand

Product Description

The Wurtec **Jack Stands** are rated for 10,000 lbs when equally loaded and used as a set. They are adjustable and are designed to be secured in a vertical position when fastened to the guide rails. This allows you to lower the car or counterweight onto the jack stand from outside the pit.

This is a great easy-to-use safety product. Every pit should have a set.

Product Specifications

The Jack Stand pairs are designed to accommodate various rail sizes, including T89 (8#), T127-1 (12#), T127-2 (15#), and T140-1 (18.5#). With a maximum extension of 7 feet, they offer versatility and stability while weighing only 60.5 lbs.

Product Instructions

- Place both jack stands in location in the pit, one on each side of the hoistway. Position them so they sit squarely on the floor so they will strike the car or counterweight frame at a location designed to support the load.
- Clamp both top and bottom rail clamps onto rail.
- Extend jack stands to desired height and pin with Unistrut lock pins.
- Ensure adequate clearance is provided between any components on or attached to the car or counterweight frame and the jack stand.
- Get out of the pit and slowly lower the car or counterweight onto the jack stands until secure. Adjust the treaded jack bolts as required to ensure that each jack stand is supporting approximately half of the weight.
